

In re Patent Application of:
CANTONI ET AL.
Serial No. 09/919,725
Filed: JULY 31, 2001

In the Claims:

Claims 1-14 (cancelled)

Claim 15 (cancelled)

Claim 16 (cancelled)

Claim 17 (cancelled)

Claim 18 (cancelled)

Claim 19 (currently amended) ~~A method as claimed in claim 18~~ A method of transmitting variable length messages on a network from a source to a destination, said method comprising

segmenting each message into a plurality of fixed length slots, each of which slots includes a header field and a message segment,

providing a source identifier field in the header field of each slot, said source identifier field including a source identifier code that is uniquely associated with the message to be transmitted,

providing a type field in the header of each slot,
coding into the type field, a code selected from a first code, a second code, and a third code, respectively representing a beginning of a message, a continuation of a message, and an end of a message,

transmitting the slots on the network, and

In re Patent Application of:

CANTONI ET AL.

Serial No. **09/919,725**

Filed: **JULY 31, 2001**

controlling the reassembly of received slots at the destination in accordance with said source identifier code, the first code, the second code, and the third code,

storing message segments associated with a single message in a buffer, and further comprising providing the source identifier code to a comparator in response to detection of said first code at said destination, and

in response to detection of the second code associated with a subsequently received slot providing the source identifier thereof to the comparator to check for a match, and

storing the message segment of the subsequently received slot in said buffer in response to detection of a match.

1
Claim 20 (previously amended) A method as claimed in claim 19, further comprising outputting the reassembled slots in the buffer from the buffer as a reassembled message in response to detection of said third code.

Claim 21 (cancelled)

Claim 22 (currently amended) ~~A method as claimed in claim 20,~~ A method of transmitting variable length messages on a network from a source to a destination, said method comprising

segmenting each message into a plurality of fixed length slots, each of which slots includes a header field and a message segment,

providing a source identifier field in the header field of each slot, said source identifier field including a source

In re Patent Application of:

CANTONI ET AL.

Serial No. 09/919,725

Filed: JULY 31, 2001

identifier code that is uniquely associated with the message to be transmitted,

providing a type field in the header of each slot,

coding into the type field, a code selected from a first code, a second code, and a third code, respectively representing a beginning of a message, a continuation of a message, and an end of a message,

transmitting the slots on the network, and

controlling the reassembly of received slots at the destination in accordance with said source identifier code, the first code, the second code, and the third code, and further comprising

coding, into the type field, a fourth code representing a single segment message, and

if said fourth code is detected in a slot received at the destination, storing the message segment thereof in a single segment buffer; and further comprising providing multiple comparators and buffers at the destination so as to enable simultaneous receipt of a plurality of messages, each having its own source identifier code, and

storing the message segments of each message in respective buffers.

Claim 23 (cancelled)

Claim 24 (cancelled)

Claim 25 (currently amended) ~~Apparatus as claimed in claim 23~~ Apparatus for transmitting variable length messages

In re Patent Application of:

CANTONI ET AL.

Serial No. 09/919,725

Filed: JULY 31, 2001

on a network from a source to a destination in fixed length slots, said apparatus including;

a segmentation machine for segmenting the messages into fixed length slots, each of which includes a header field and a message segment, said segmentation machine including coding means

for providing a source identifier field in the header of each slot, said source identifier field including a source identifier code that is uniquely associated with the message to be transmitted, and

for providing a type field in the header field of each slot, and

for providing a code selected from a first code, a second code, and a third code representing, respectively, a beginning of a message, a continuation of a message and an end of a message; and

a reassembly machine located, in use, at the destination, said reassembly machine including control means for controlling reassembly of the slots in accordance with respective source identifier codes of the slots, said control means being responsive to said source identifier code, said first code, said second code, and said third code, and wherein the message includes a destination address field and wherein the segmentation machine is arranged to transmit the destination address field in the message segment of the first slot of the message.

Claim 26 (cancelled)

In re Patent Application of:
CANTONI ET AL.
Serial No. 09/919,725
Filed: JULY 31, 2001

Claim 27 (cancelled)

Claim 28 (cancelled)

Claim 29 (cancelled)

Claim 30 (previously amended) A method for the connection-oriented transfer of variable-length messages in fixed-length slots from a source node having a source address to a destination node having a destination address, the method comprising:

segmenting each message into a plurality of fixed-length slots including a first slot, continuing slots and a last slot, each of the slots including a header field and a message segment;

providing, in the header field of each of the slots, a source identifier code associated with the message,

providing a type field for holding a code in the header of each slot,

coding into the type field, a code selected from a first code, a second code, and a third code, respectively representing a beginning of a message, a continuation of a message, and an end of a message,

transmitting the slots from the source node; and

controlling reassembly of the message on the basis of information in the header field of slots received at the destination node;

In re Patent Application of:
CANTONI ET AL.
Serial No. 09/919,725
Filed: JULY 31, 2001

storing, in a buffer at the destination node, message segments associated with a single message, and further comprising

providing, to a comparator, the source identifier code of the first slot received at the destination node;

providing, to the comparator, the source identifier code of each subsequently received slot; and

storing the message segment of the subsequently received slot in the buffer in response to an occurrence of a match between the source identifier code of the first slot and the source identifier code of subsequent slots.

Claim 31 (previously amended) The method as claimed in claim 30, further comprising outputting a reassembled message from the buffer in response to detection of the third code.

Claim 32 (previously amended) The method as claimed in claim 30, further comprising providing multiple comparators and buffers at the destination node to enable simultaneous receipt of a plurality of messages, each having its own source identifier code, and

storing message segments from each message in a separate buffer.

Claim 33 (cancelled)

Claim 34 (previously amended) An apparatus for the connection-oriented transfer of variable-length messages in

In re Patent Application of:

CANTONI ET AL.

Serial No. **09/919,725**

Filed: **JULY 31, 2001**

fixed-length slots from a source node, having a source address, to a destination node, having a destination address, the apparatus comprising:

a segmentation machine for segmenting each message into a plurality of fixed-length slots including a first slot, continuing slots, and a last slot, each of the fixed-length slots including a header field, and a message segment, the segmentation machine being located, in use, at the source node;

a coder for providing, in the header field of each slot, a source identifier field for holding a source identifier code associated with the message to be transmitted, and

a type field, for holding a code selected from a first code, a second code, and a third code, respectively representing a beginning of a message, a continuation of a message, and an end of a message, and

a reassembly machine for controlling reassembly of slots into the message in accordance with information in the header field, the reassembly machine being located, in use, at the destination node

wherein the reassembly machine further comprises a selector for checking the third code and for providing source identifier codes to a comparator for comparison with subsequently received source identifier codes.

Claim 35 (previously amended) The apparatus as claimed in claim 34, wherein the reassembly machine further

In re Patent Application of:
CANTONI ET AL.
Serial No. 09/919,725
Filed: JULY 31, 2001

comprises a plurality of comparators for enabling concurrent receipt of slots associated with different messages.

Claim 36 (previously amended) The apparatus as claimed in claim 35, further comprising means for providing source identifier codes of received slots to the plurality of comparators, thereby enabling the comparators to match slots having the same source identifier codes.

Claim 37 (previously amended) The apparatus as claimed in claim 36, further comprising:

a plurality of buffers for the message segments of the slots, and

I a buffer selector circuit for selecting a particular buffer for receipt of all message segments of slots having the same source identifier code.

Claim 38 (previously amended) The apparatus as claimed in claim 34, wherein the reassembly machine comprises a controller and the controller is configured to output a reassembled message from the buffer in response to detection of a third code, the reassembled message being associated with the source identifier code of the slot containing the detected third code.
